CAREER OBJECTIVE

Motivated Computer Science student with full-stack and ML experience, strong problem-solving skills, and hands-on internship exposure. Passionate about building innovative solutions, collaborating in dynamic teams, and growing with emerging technologies to deliver impactful results.

WORK EXPERIENCES

Kidzian Pvt Ltd, Bangalore – AI Python Developer Intern

July 2025 – September 2025

Bizowl, Delhi – Full Stack Developer Intern

May 2025 – July 2025

Suthra Technologies Pvt Ltd, Vijayawada – MERN Stack Developer Intern

June 2024 – November 2024

EDUCATION

PSCMR College, Vijayawada, B. Tech in CSE –DS

(2022–2026)

SKILLS AND TOOLS

- **Web Technologies:** JavaScript (ES6+), Node.js, Express.js, React.js
- **Database:** MongoDB, Firebase, PostgreSQL
- **API:** REST API development/testing with Postman, auth key generation & management
- **Machine Learning:** Python, NumPy, Pandas, Scikit-Learn, Matplotlib, data preprocessing & model evaluation

PROJECTS

Smart Safety Assistant for Women

- The frontend was made using React with the main features, such as building reusable components, routing, and clean UI for input and result visualization.
- The design of the workflow was such that the frontend would collect user data, validate it and then send it to the backend via REST API calls.
- The backend was constructed with FastAPI + Uvicorn, building up very fast, asynchronous endpoints that would take care of the requests coming from the React application.

- The backend was constructed with FastAPI + Uvicorn, building up very fast, asynchronous endpoints that would take care of the requests coming from the React application.
- A Random Forest machine learning model was applied by going through data preprocessing, training, testing, and saving the model for inference.
- The model was integrated into the backend such that user inputs from the website were sent to the ML model for real-time prediction.
- Three prediction endpoints were established that provide clear JSON responses back to the frontend for rendering.
- All API routes were tested with Postman which consisted of payload validation, response verification, and authentication key management.
- The full pipeline was connected: User Input → API Request → ML Model Prediction → API Response → Frontend Display, ensuring that everything worked perfectly from start to finish.

AI Agent Task Management

- Initially, the project was a full-stack web application, which was able to collect user input through a React interface and handle it via a Python backend using REST APIs.
- I was responsible for the frontend part and selected React + Vite for this purpose, so, above all, I developed reusable components, input forms, pages, and responsive layouts that could be controlled via API calls to the backend.
- The workflow goes like this: User Input → API Request → FastAPI Backend Logic → JSON Response → React UI Rendering—all steps are interconnected and form a smooth end-to-end process.
- Postman was used for thorough testing of all API routes, thus, validating request formats, responses, error messages, and authentication key handling.
- The final system was able to integrate the frontend and backend effortlessly which in turn allowed real-time communication, clean data flow, and the existence of a fully functional interactive website.

CERTIFICATIONS & COURSES

- Generative AI Certification in Oracle
- Data Mining Certification in NPTEL
- Applied Accelerated in Artificial Intelligence Certification in NPTEL
- Attended Web Development and AI Tools Workshop

ADDITIONAL INFORMATION

- **Languages Known:** English, Telugu
- **Additional Interests:** Continuous learner with a focus on adopting new and emerging technologies
